

SAN Services of MEN@NET: fast-acting, secure, high-performance

The advantages of a Storage Area Network (SAN) are obvious: Efficiency, flexibility, speed and above all disaster tolerance are key factors. Certainly, all network components should be compatible and communicate error-free with each other. The compatibility of different original equipment manufacturers (OEM) equipment is usually an issue before an upcoming expansion of the network. Nevertheless the performance of the SAN should be guaranteed, too. And that is where we come in.

The company specialises in network and performance management of high-speed data networks. We provide a comprehensive product portfolio for your SAN. We have developed our own monitoring software SAN RM and offer services, training, workshops as well as measurement and analysis equipment from popular vendors. Since 1999 we have been your reliable partner in this sector.

MEN@NET Health Check

SAN is the heart of your IT. Regardless of the industry your company operates in, your SAN has to meet certain requirements to ensure trouble-free IT operations. Performance degradation, data loss, or even system downtime can impede the processes of your entire company. With MEN@NET Health Check you are on the safe side. Our experts evaluate and analyse your SAN environment with an external view, independent of manufacturers. The condition and evolution of the system infrastructure should be thoroughly examined on a regular basis in order to detect irregularities at an early stage. Apparently minor problems can usually be solved quickly, thus preventing possible bottlenecks or, in the worst case, even outages. Depending on your requirements, a comprehensive analysis of your entire environment, a specific SAN area, or a compact, anomaly-focused investigation can be performed. MEN@NET Health Check is an assessment of your SAN environment. The added value is obvious: optimal SAN operation ensures security, improves efficiency and thus also reduces costs.

Health Check

"MEN@NET Health Check" is performed according to proven procedures. For a situational analysis of your SAN we install our monitoring software SAN RM which will be used to collect and store the data necessary for evaluation. This process is followed by data evaluation and report generation. Recommendations and mitigation procedures are shown for potential weak points in the configuration. The results serve as decision support for upcoming projects like architecture changes or new investments. The results also provide a neutral basis for discussion with manufacturers and suppliers of SAN components.

Our Service - Your Benefit: **MEN@NET Health Check** in brief

- Assessment of the SAN environment
- Avoid unexpected breakdowns
- Flexible in observation period and scope
- Presentation of potential problems and development of possible solutions
- Manufacturer-independent evaluation of the current situation in the SAN
- Management report with suggestions for improvement
- Presentation of the results

Our services for high-speed data networks

Health Check

Manufacturer-independent analysis of the SAN environment.

Review Meetings

Workshops on a regular basis to stabilise the SAN.

Remote Monitoring

Continuous monitoring of the SAN by our experts.

Troubleshooting

Immediate fault isolation of urgent SAN problems.

Pre-Deployment

Proactive verification of technology changes in the SAN.

Consulting

Individual consulting for questions about complex SAN and networks
